Light-Core
Core Build-Up Composite

Instructions for Use

Caution: U.S. Federal law restricts this device to sale by or on the order of a licensed Dentist.
LIGHT-CORE™
Core Build-Up Composite

GENERAL INFORMATION

LIGHT-CORE is a radiopaque, light-cured, fiber-reinforced, core build-up composite. Sculptable and non-slumping, LIGHT-CORE may be bulk cured up to 5mm. Sculptable (or non-sticky) handling and excellent viscosity allow for easy contouring and adaptation to the tooth and post. It is available in two shades: TRANSLUCENT and BLUE. Once polymerized, LIGHT-CORE exhibits outstanding physical properties and the ability to prep like dentin without ditching. LIGHT-CORE is available in economical syringes and convenient unit-dose tips.

TRANSLUCENT is ideal for use under aesthetic restorations. It may be bulk cured up to 5mm when light-cured for 20 seconds.

BLUE is ideal for use in conventional fixed restorations. It facilitates placement when a contrast to tooth structure is required. It may be bulk cured up to 5mm when light-cured for 30 seconds.

Indications for Use:
• Restoration where a light-cured composite for core build-up is preferred.

Cautions:
• Cross-contamination: Product may contain items that are designed for one time use. Dispose of used or contaminated unit-dose tips. Do not clean, disinfect or reuse.

Precautions:
• In order to achieve a 5mm bulk cure the curing light tip should be placed at 0mm from the composite material after the first 5 seconds of light curing.
• Avoid contact with the skin. In case of contact with the skin, wash thoroughly with soap and water. Unpolymerized resins may cause skin sensitization in susceptible persons.
• See individual component labels for specific expiration dates.
• Safety data sheet available on request.

INSTRUCTIONS FOR USE

1. Isolate and clean all surfaces that will receive the core material.
2. Apply an adhesive, according to the manufacturer’s instructions.
3. If a post is to be placed it should be cemented according to the manufacturer’s instructions.
4. Apply and adapt LIGHT-CORE material to the preparation and post, if present, and form the appropriate anatomy with an instrument. It is recommended that the material be tamped into the preparation with an instrument to eliminate any potential voids prior to curing.

NOTE: To prevent excessive material from extruding from syringe, turn handle counterclockwise immediately after the desired amount is dispensed.

5. Light cure each increment: TRANSLUCENT for a minimum of 20 seconds; BLUE for a minimum of 30 seconds. After the first 5 seconds of curing, place the light tip in direct contact with the core material to maximize 5mm bulk cure.
6. Prepare and finish the core. Ensure that a ferrule of 2mm is remaining on natural tooth structure.

DISPOSAL: Refer to community provisions relating to waste. In their absence, refer to national or regional provisions relating to waste.

STORAGE: Store at room temperature (20°C/68°F - 25°C/77°F).
